and if  $wM_i \subset M_i$  for one of the  $M_i$  then  $wM_1M_2 \cdots M_n \subset M_1M_2 \cdots M_n$ . We shall use these remarks and Lemma 1 to prove checked 18/2

và nếu  $wM_i \subset M_i$  đối với một trong các  $M_i$  thì  $wM_1M_2 \cdots M_n \subset M_1M_2 \cdots M_n$ . Chúng ta sẽ dùng những tính chất này và Bổ đề 1 để chứng minh

**THEOREM 4.23.** If  $E$  is a field and  $R$  is a subring of  $E$ , the set  $A$  of  $R$ -integral elements of  $E$  is a subring of  $E$  containing  $R$ . Moreover, any element of  $E$  which is  $A$ -integral is  $R$ -integral (and so is contained in  $A$ ).

**Định lý 4.23.** Nếu  $E$  là một trường và  $R$  là một vành con của  $E$ , tập hợp  $A$  các phần tử  $R$ -nguyên của  $E$  là một vành con của  $E$  chứa  $R$ . Hơn nữa, bất kỳ phần tử nào của  $E$  là  $A$ -nguyên cũng là  $R$ -nguyên (và vì vậy sẽ nằm trong  $A$ ).

**Proof.** Let  $u$  and  $v \in A$  so that there exist finitely generated  $R$ -submodules  $M$  and  $N$  of  $E$  containing  $1$  such that  $uM \subset M$  and  $vN \subset N$ . Then  $(u+v)MN \subset u(MN) + v(MN) \subset MN$ . Also  $(uv)MN \subset MN$ . Since  $1 \in MN$  the conditions of Lemma 1 are satisfied for  $u+v$ ,  $1$  and  $uv$ . Hence these elements are  $R$ -integral and  $A$  is thus a subring of  $E$ . It is clear also that  $A \supset R$ . Now let  $u$  be  $A$ -integral. Then we have an  $M = Au_1 + \cdots + Au_n$ , containing  $1$  and satisfying  $uM \subset M$ . We may as well assume  $u_1 = 1$ . Since  $uM \subset M$  there exist  $a_{ij} \in A$  such that  $ua_{ij} = \sum_j a_{ij}u_j$ . Now there exists a finitely generated  $R$ -submodule  $N_j$  such that  $a_{ij}N_j \subset N_j$  and  $1 \in N_j$ . Multiplying together the  $N_j$  we obtain a finitely generated module  $N = Rv_1 + \cdots + Rv_m$  with  $v_1 = 1$  satisfying  $at_jN \subset N$  for every  $a \in A$ . Let  $P = Ru, v_j$ . Then  $1 = u_1v_1 \in P$  and  $u(U_i v_k) = \sum_j a_{ij}u_j v_k = \sum_j u_{ij}v_k$ . Since  $a_{ij}v_k \in N$  this is an  $R$ -linear combination of the elements  $U_j v_k$ . It follows that  $uP \subset P$ , and so  $u$  is  $R$ -integral, by Lemma 1,  $\square$

*Proof.* Let  $u$  and  $v \in A$  so that there exist finitely generated  $R$ -submodules  $M$  and  $N$  of  $E$  containing  $1$  such that  $uM \subset M$  and  $vN \subset N$ . Then  $(u \pm v)MN \subset u(MN) + v(MN) \subset MN$ . Also  $(uv)MN \subset MN$ . Since  $1 \in MN$  the conditions of Lemma 1 are satisfied for  $u \pm v$ ,  $1$  and  $uv$ . Hence these elements are  $R$ -integral and  $A$  is thus a subring of  $E$ . It is clear also that  $A \supset R$ . Now let  $u$  be  $A$ -integral. Then we have an  $M = Au_1 + \dots + Au_n$  containing  $1$  and satisfying  $uM \subset M$ . We may as well assume  $u_1 = 1$ . Since  $uM \subset M$  there exist  $a_{ij} \in A$  such that  $uu_i = \sum a_{ij}u_j$ . Now there exists a finitely generated  $R$ -submodule  $N_{ij}$  such that  $a_{ij}N_{ij} \subset N_{ij}$  and  $1 \in N_{ij}$ . Multiplying together the  $N_{ij}$  we obtain a finitely generated module  $N = Rv_1 + \dots + Rv_m$  with  $v_1 = 1$  satisfying  $a_{ij}N \subset N$  for every  $a_{ij}$ . Let  $P = \sum_{i,j} Ru_iv_j$ . Then  $1 = u_1v_1 \in P$  and  $u(u_iv_k) = \sum a_{ij}u_jv_k = \sum u_ja_{ij}v_k$ . Since  $a_{ij}v_k \in N$  this is an  $R$ -linear combination of the elements  $u_jv_k$ . It follows that  $uP \subset P$ , and so  $u$  is  $R$ -integral, by Lemma 1.  $\square$

Chứng minh. Giả sử  $u$  và  $v \in A$  sao cho tồn tại các  $R$ -mô-đun con được sinh hữu hạn  $M$  và  $N$  của  $E$  chứa  $1$  sao cho  $uM \subset M$  và  $vN \subset N$ . Thế thì  $(u \pm v)MN \subset u(MN) + v(MN) \subset MN$ . Tương tự  $(uv)MN \subset MN$ . Bởi vì  $1 \in MN$  các điều kiện của Bổ Đề 1 được thỏa mãn đối với  $u \pm v$ ,  $1$  và  $uv$ . Vì thế, những phần tử này là  $R$ -nguyên và vì thế  $A$  là một vành con của  $E$ . Chúng ta cũng dễ dàng thấy rằng  $A \supset R$ . Bây giờ giả sử  $u$  là  $A$ -nguyên. Thế thì chúng ta có một  $M \supset Au_1 + \dots + Au_n$ , chứa  $1$  và thỏa mãn  $uM \subset M$ . Chúng ta cũng có thể giả sử  $u_1 = 1$ . Bởi vì  $uM \subset M$  tồn tại  $a_{ij} \in A$  sao cho  $uu_i = \sum a_{ij}u_j$ . Bây giờ, tồn tại một  $R$ -mô-đun con được sinh hữu hạn  $N_{ij}$  sao cho  $a_{ij}N_{ij} \subset N_{ij}$  và  $1 \in N_{ij}$ . Cùng nhân với  $N_{ij}$  chúng ta thu được một mô-đun được sinh hữu hạn  $N = Rv_1 + \dots + Rv_m$  cùng với  $v_1 = 1$  thỏa mãn  $a_{ij}N \subset N$  đối với mỗi  $a_{ij}$ . Đặt  $\sum_{i,j} Ru_iv_j$ . Thế thì  $1 = u_1v_1 \in P$  và  $u(u_iv_k) = \sum a_{ij}u_jv_k = \sum u_ja_{ij}v_k$ . Bởi vì  $a_{ij}v_k \in N$  đây là  $R$ -tổ hợp tuyến tính của các phần tử  $u_jv_k$ . Suy ra rằng  $uP \subset P$ , và vì vậy  $u$  là  $R$ -nguyên, theo Bổ Đề 1,  $\square$

In the case in which  $R = F$  is a subfield this result states that the elements of  $E$  which are algebraic over  $F$  constitute a subring. Moreover, in this case, if  $u$  is algebraic, then  $F(u) = F[u]$  and  $1/u$  is therefore algebraic for  $u \neq 0$ . Hence the set of elements of  $E$  which are algebraic over  $F$  constitute a subfield  $A$  of  $E$  and every element of  $E$  which is algebraic over  $A$  is contained in  $A$ .

In the case in which  $R = F$  is a subfield this result states that the elements of  $E$  which are algebraic over  $F$  constitute a subring. Moreover, in this case, if  $u$  is algebraic, then  $F(u) = F[u]$ , and  $u^{-1}$  is therefore algebraic for  $u \neq 0$ . Hence the set of elements of  $E$  which are algebraic over  $F$  constitute a subfield  $A$  of  $E$  and every element of  $E$  which is algebraic over  $A$  is contained in  $A$ .

We now specialize  $E = \mathbb{C}$  and  $R = \mathbb{Q}$  or  $\mathbb{Z}$ . Then the  $\mathbb{Q}$ -integers are the algebraic numbers and the  $\mathbb{Z}$ -integers are algebraic integers. We have the following criterion for a complex number to be an algebraic integer:

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

*Proof.* If  $a \in \mathbb{Z}$  it is  $\mathbb{Z}$ -integral. On the other hand, if  $a \in \mathbb{Q}$  its minimum polynomial over  $\mathbb{Q}$  is  $x - a$ , so if  $a$  is an algebraic integer then  $a \in \mathbb{Z}$ . Now let  $u \in \mathbb{C}$  be algebraic over  $\mathbb{Q}$  and let  $f(x) = x^n + \alpha_1 x^{n-1} + \cdots + \alpha_n \in \mathbb{Q}[x]$  be a polynomial such that  $f(u) = 0$ . If  $b \in \mathbb{Z}$ ,  $b \neq 0$ , then  $bu$  is a root of  $b^n f(b^{-1}x) = 0$  and  $b^n f(b^{-1}x) = b^n(b^{-n}x^n + b^{-(n-1)}\alpha_1 x^{n-1} + \cdots + \alpha_n) = x^n + b\alpha_1 x^{n-1} + \cdots + b^n \alpha_n$ . If we choose  $b$  to be the product of the denominators of the rational numbers  $\alpha_i$  we obtain a monic polynomial in  $\mathbb{Z}[x]$  having  $bu$  as a root. Then  $bu$  is an algebraic integer.  $\square$

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

We shall need to use the so-called fundamental theorem of algebra, which states that any polynomial in  $\mathbb{C}[x]$  of positive degree has a root in  $\mathbb{C}$ . This result, which will be proved in section 5.1, implies that every monic polynomial of positive degree with coefficients in  $\mathbb{C}$  factors as a product  $\prod (x - r_i)$  in  $\mathbb{C}[x]$ . In other words,  $\mathbb{C}$  contains a splitting field for every monic polynomial  $\neq 1$  in  $\mathbb{C}[x]$ . It follows that if  $S$  is a finite set of algebraic numbers we can imbed  $\mathbb{Q}(S)$  in a Galois extension  $K/\mathbb{Q} \subset \mathbb{C}$ .

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

the field of algebraic numbers  $A$  and its additive group, we now denote the latter as  $A'$  and its elements as  $u'$ , where  $u \rightarrow u'$  is an isomorphism of  $(A, +, 0)$  onto  $A'$ . We write the composition in  $A'$  as multiplication. Then  $a \rightarrow a'$  is 1-1 and  $a'b' = (a + b)'$ ,  $0'$  is the unit of  $A'$  and  $(-a)'$  is the inverse of  $a'$ . The group algebra  $A[A']$  we are interested in, is the set of sums  $\sum v_i u'_i$ ,  $v_i \in A$ ,  $u'_i \in A'$ , where addition is the obvious one, and multiplication is given by the distributive law, and  $(v_1 u'_1)(v_2 u'_2) = v_1 v_2 (u_1 + u_2)'$ . Moreover, if  $u_1, \dots, u_n$  are distinct elements of  $A$ , then the elements  $u'_1, u'_2, \dots, u'_n$  are linearly independent over  $A$ : that is,  $\sum v_i u'_i = 0$  for  $v_i \in A$  implies that every  $v_i = 0$ . Now, in  $\mathbb{C}$  we have  $e^{u_1} e^{u_2} = e^{u_1 + u_2}$ . Hence, by the "universal" property of group algebras given in exercise 8, p. 127, we have a homomorphism  $\varepsilon$  of  $A[A']$  into  $\mathbb{C}$  sending  $\sum v_i u'_i$  into  $\sum v_i e^{u_i}$ . Theorem 4.22 can now be restated as:  $\varepsilon$  is a monomorphism.

...  $\mathbb{Z}$  ...  $\mathbb{C}$  ... can now be restated as:  $\iota$  is a monomorphism.

The group algebra  $A[A']$  is commutative. We shall now show that it is a domain. To see this we introduce an ordering in  $\mathbb{C}$  which is compatible with addition, the so-called lexicographic ordering of  $\mathbb{C}$ . If  $x = a + bi$  and  $y = c + di$  where  $a, b, c, d$  are real, then we say that  $x > y$  if  $a > c$  or if  $a = c$  and  $b > d$ . This ordering satisfies the trichotomy law: for any pair  $(x, y)$  either  $x > y$ ,  $x = y$ , or  $y > x$ . Moreover, if  $x > y$  and  $z > t$  then  $x + z > y + t$ . Now let  $\sum_1^n v_i u_i'$ ,  $\sum_1^m z_j t_j'$  be two non-zero elements of  $A[A']$ . Then we may assume that  $v_1 \neq 0$ ,  $z_1 \neq 0$ , and  $u_1 > u_2 > \dots > u_n$ ,  $t_1 > t_2 > \dots > t_m$ . Then  $(\sum v_i u_i')(\sum z_j t_j') = v_1 z_1 (u_1 + t_1)' +$  a sum of terms of the form  $wq'$  where  $q < u_1 + t_1$ . Clearly this is not zero, so  $A[A']$  is a domain.

Suppose  $\sum v_i u_i \in \ker \varepsilon$ . We can imbed the  $u_i$  and  $v_i$  in a Galois subfield  $K/\mathbb{Q}$  of  $\mathbb{C}$ . Then the subset of elements of the form  $\sum x_i y_i$  with  $x_i, y_i \in K$  is a subring  $K[K']$  of  $A[A']$ , and if  $\eta \in G = \text{Gal } K/\mathbb{Q}$ , then  $\eta$  defines two automorphisms in  $K[K']$ . The first of these, which we shall denote as  $\sigma(\eta)$ , is  $\sum x_i y_i \rightarrow \sum \eta(x_i) y_i$ , and the second is  $\tau(\eta): \sum x_i y_i \rightarrow \sum x_i (\eta(y_i))$ . The fact that these are automorphisms is clear. Now suppose  $\sum v_i u_i \neq 0$ . Then if  $G = \{\eta_1, \eta_2, \dots, \eta_m\}$  every  $\sigma(\eta_j)(\sum v_i u_i) \neq 0$  and hence

[REDACTED]

Since  $U$  contains the factor  $\sum v_i u'_i$ ,  $U \in \ker \varepsilon$ . It is clear from the commutativity of  $A[A']$  that  $\sigma(\eta)U = U$  for every  $\eta = \eta_k \in G$ . Hence if we write  $U$  as  $\sum z_i t'_i$  with distinct  $t'_i$ , then  $\eta U = U$ , that is,  $\sum \eta(z_i) t'_i = \sum z_i t'_i$ , implies  $\eta(z_i) = z_i$  for every  $z_i$  and every  $\eta \in G$ . Then  $z_i \in \mathbb{Q} = \text{Inv } G$ . We have therefore shown that if we have a non-zero element in  $\ker \varepsilon$  then we have one of the form  $\sum v_i u'_i$  with rational  $v_i$ . Now apply  $\tau(\eta_j)$  to this element and form

[REDACTED]

[REDACTED]

[REDACTED]

Then this is a non-zero element of  $\ker \varepsilon$  satisfying  $\tau(\eta)V = V$  for all  $\eta \in G$ . We can write  $V = \sum z_i t'_i$  where the  $z_i \in \mathbb{Q}$  and we have  $\sum z_i (\eta(t'_i)) = \sum z_i t'_i$ ,  $\eta \in G$ . We now average these various expressions for  $V$  to obtain

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

We have now shown that  $\ker \varepsilon \neq 0$  implies that we have a non-zero element in  $\ker \varepsilon$  of the form  $\sum v_i T'(t_i)$  where the  $v_i \in \mathbb{Q}$ . Also, by combining terms we may assume that  $T'(t_i) \neq T'(t_j)$  for  $i \neq j$ , which implies that  $t_j \neq \eta(t_i)$  for every  $\eta \in G$ .

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

This relation shows that if  $\sum v_i T'(t_i) \in \ker \varepsilon$  with  $v_i \in \mathbb{Q}$ ,  $v_1 \neq 0$ , and  $t_j \neq \eta(t_i)$  for every  $i \neq j$  and  $\eta \in G$ , then multiplication by  $T'(-t_1)$  gives an element in  $\ker \varepsilon$  of the form

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

with  $v_i \in \mathbb{Q}$ ,  $v_0 \neq 0$ ,  $u_i \neq 0$ . Multiplication by a suitable integer allows us to assume the  $v_j$  are integers. The fact that  $(64) \in \ker \varepsilon$  implies that we have the relation (63).

[REDACTED]

[REDACTED]

So far the argument has been purely algebraic. We now come to the analytic part of the proof, which will consist of establishing a contradiction to a relation of the form (63) where the  $v_i$  are integers,  $v_0 \neq 0$ , and the  $u_i$  are algebraic numbers  $\neq 0$ . We assume that all the  $u_i$  and hence all  $\eta_j(u_i)$  are roots of a polynomial  $f(x) = \sum_0^t a_k x^k \in \mathbb{Z}[x]$ ,  $a_0 \neq 0$ . Let  $p$  be a prime and introduce

[REDACTED]

[REDACTED]

where  $s = tp + p - 1$ . Then the  $b_j \in \mathbb{Z}$ ,  $b_{p-1} = a_0^p$  and for  $p - 1 \leq j \leq s$  we have

[REDACTED]

It is understood here that the first bracket is 0 if  $j = p - 1$ . Moreover, if  $j \geq p$ , then  $\frac{j!}{(j-p)!} = p! \binom{j}{p}$  so this is  $p!$  times an integer. A fortiori,  $\frac{j!}{k!}$ ,  $0 \leq k < j - p$ , is  $p!$  times an integer and hence the first bracket in (65) is  $p!$  times an integral polynomial. Now put

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

where  $g_p(x) \in \mathbb{Z}[x]$ . We observe next that

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

and these are all divisible by  $f(x)$  since  $h(x) = x^{p-1}f(x)^p$ . Hence the first summation in (67), which is  $h'(x) + h''(x) + \cdots + h^{(p-1)}(x)$ , is divisible by  $f(x)$  and this becomes 0 when we put  $x = u_i$ . Next we need to estimate  $|R(u_i)|$  where  $R(x)$  is the second summation in (67). We now assume that the prime  $p$  is chosen so that  $p > 2|u_i|$  for all  $u_i$ . Then since  $j + 1 \geq p$  also, we have

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

if  $M$  is the largest of the  $2n$  numbers  $\sum_0^t |a_k| |u_i|^k$  and  $\sum_0^t |a_k| |u_i|^{k+1}$  for  $i = 1, 2, \dots, n$ . Hence if  $p > 2|u_i|$  then we have

[REDACTED]

[REDACTED]

[REDACTED]

Moreover, if in addition  $p > |a_0|$ , then  $N_p$ , which is given by (66), is not divisible by  $p$  since  $N_p \equiv b_{p-1} = a_0^p \equiv a_0 \pmod{p}$ . We therefore have the following

[REDACTED]

[REDACTED]

LEMMA 3. Let  $u_i, 1 \leq i \leq n$ , be non-zero algebraic numbers,  $f(x) = \sum_0^t a_k x^k \in \mathbb{Z}[x]$ ,  $a_0 \neq 0$ , be a polynomial such that  $f(u_i) = 0$  for all  $i$ . Let  $M$  be the maximum of the  $2n$  numbers  $\sum_{k=0}^t |a_k| |u_i|^k$  and  $\sum_{k=0}^t |a_k| |u_i|^{k+1}$  and let  $p$  be a prime  $> \max(|a_0|, 2|u_1|, \dots, 2|u_n|)$ . Then there exists an integer  $N_p$  not divisible by  $p$  and a polynomial  $g_p(x) \in \mathbb{Z}[x]$  of degree  $< tp$  such that the inequalities (68) hold.<sup>14</sup>

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

as in Lemma 3. The numbers  $\eta_j(u_i), \eta_j \in G = \text{Gal } K/\mathbb{Q}$ , are also roots of  $f(x)$ . Hence, by Lemma 3, for all sufficiently large primes  $p$  there exists an integer  $N_p$  not divisible by  $p$  and an integral polynomial  $g_p(x)$  of degree  $< pt, t = \deg f$ , such that  $|N_p e^{\eta_j(u_i)} - p g_p(\eta_j(u_i))| < 2M^p/(p-1)!$  for all  $i = 1, \dots, n, j = 1, \dots, r (=|G|)$ . Now let  $k$  be a positive integer such that  $ku_i^l$  is an algebraic integer for every  $u_i$  and every  $l \leq t$ . The existence of such a  $k$  is assured by Theorem 4.24. Then  $k^p g_p(u_i)$  is an algebraic integer and hence every  $k^p g_p(\eta_j(u_i))$  is an algebraic integer. Also  $\sum_{j=1}^r k^p g_p(\eta_j(u_i))$  is an algebraic integer, but since it is fixed by  $G$ , it is a rational number. Hence this is an integer, by Theorem 4.23.

Now we have

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

where  $M$  is as before and  $L$  is a positive upper bound for the  $|v_i|$ ,  $1 \leq i \leq n$ . The numbers  $p k^{p v_i} \sum_{j=1}^r g_p(\eta_j(u_i))$  are integers divisible by  $p$  whereas  $N_p$  is not. Moreover, if  $p$  is sufficiently large then  $p \nmid k$  and  $p \nmid v_0$  so  $p \nmid k^{p v_0}$ . Hence the left-hand side of the inequality

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

1. Show that  $\sin u$  is transcendental for all algebraic  $u \neq 0$ . (Hint: Use  $\sin u = (1/2i)(e^{iu} - e^{-iu})$  and the transcendence of  $e^{iu}$ .)

[REDACTED]

2. Show that  $\csc u$ ,  $\cos u$ ,  $\sec u$ ,  $\tan u$ ,  $\cot u$  are transcendental for any algebraic  $u \neq 0$ .

[REDACTED]

3. Let  $m$  be an integer without square factors and let  $F = \mathbb{Q}(\sqrt{m})$ , the subfield of  $\mathbb{C}$  generated by  $\sqrt{m}$ . Show that  $F$  is the set of complex numbers of the form  $a + b\sqrt{m}$  where  $a, b \in \mathbb{Q}$ . Let  $I$  be the subset of  $F$  of integral algebraic numbers. Show that  $I$  is a subring of  $\mathbb{C}$  and  $I$  is the set of elements  $a + b\sqrt{m}$  where  $a$  and  $b$  are rational numbers such that

We shall now apply the results of Galois theory to derive the main facts about finite fields. We observe first that if  $F$  is a finite field then  $|F| = p^n$  for some prime  $p$ . To begin with we know that the prime field of  $F$  can be identified with a field  $\mathbb{Z}/(p)$  of residues modulo  $p$  for some prime  $p$ . We may now regard  $F$  as a vector space over  $\mathbb{Z}/(p)$  in the usual way. Clearly  $[F:\mathbb{Z}/(p)]$  is finite and if  $[F:\mathbb{Z}/(p)] = n$ , then we have a base  $(u_1, u_2, \dots, u_n)$  for  $F/(\mathbb{Z}/(p))$ , and every element of  $F$  can be written in one and only one way as a linear combination  $a_1u_1 + a_2u_2 + \dots + a_nu_n$ ,  $a_i \in \mathbb{Z}/(p)$ . Evidently, this implies that  $|F| = p^n$ . The same method shows that if  $E \supset F$ ,  $[E:F] = n$ , and  $|F| = q < \infty$  then  $|E| = q^n$ .

The basic facts on finite fields can now be derived very quickly. We have first

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

$x^q - x$  in  $F$ . We observe first that since  $(x^q - x)' = -1$ ,  $x^q - x$  has  $q$  distinct roots in  $F$ . Next we shall show that  $R = \{u_1, u_2, \dots, u_q\}$  is a subfield of  $F$ . For, using the nice binomial theorem  $(a + b)^p = a^p + b^p$  for characteristic  $p$ , we see that for any  $i$  and  $j$ ,  $(u_i \pm u_j)^q = u_i^q \pm u_j^q = u_i \pm u_j$ . Hence  $u_i \pm u_j \in R$ . Also  $1 \in R$  and  $(u_i u_j)^q = u_i^q u_j^q = u_i u_j \in R$ , and if  $u_i \neq 0$ , then  $(u_i^{-1})^q = (u_i^q)^{-1} = u_i^{-1}$ . These results show that  $R$  is a subfield of  $F$ . Then  $R$  contains the prime field  $P$  and  $R = P(R) = F$ .

Next let  $F$  and  $F'$  be two fields such that  $|F| = q = |F'|$ . Clearly this implies that both  $F$  and  $F'$  are extensions of  $P = \mathbb{Z}/(p)$ . Let  $F^*$  be the set of non-zero elements of  $F$ , so that  $F^*$  is a group under multiplication and  $|F^*| = q - 1$ . Hence if  $u \neq 0$  in  $F$  then  $u^{q-1} = 1$  and  $u^q = u$ . Since the last relation holds also for  $u = 0$ , we see that every element of  $F$  is a root of  $x^q - x$ . Since this equation has no more than  $q$  distinct roots in any field it is clear that  $F$  is a splitting field over  $P$  of  $x^q - x$ . The same is true of  $F'$ . Hence the isomorphism theorem for splitting fields (Theorem 4.4, p. 227) implies that  $F$  and  $F'$  are isomorphic.  $\square$

We shall now consider the relative theory of finite fields, that is, we want to study a finite field relative to a subfield. Let  $|F| = q (= p^m)$  and let  $E$  be an extension field of  $F$  with  $[E:F] = n$ . Then, as we saw before,  $E = q^n$ . We have seen also that  $a \rightarrow a^p$  is an automorphism of  $E$  (section 4.4). Hence  $\eta: a \rightarrow a^q$  is an automorphism of  $E$ . Moreover, since  $|F| = q$ ,  $b^q = b$  for  $b \in F$ . Hence  $\eta \in \text{Gal } E/F$ . We now have

[REDACTED]

[REDACTED]

*Proof.* We show first that the order  $o(\eta) = n$ . For,  $|E| = q^n$  so  $a^{q^n} = a$  for all  $a \in E$ . Thus  $\eta^n = 1$  and if  $\eta^{n'} = 1$  for  $0 < n' < n$  then  $a^{q^{n'}} = a$ . This would contradict the fact that the polynomial  $x^{q^{n'}} - x$  has no more than  $q^{n'}$  roots in  $E$ . Hence  $o(\eta) = n$  and  $|\langle \eta \rangle| = n$ . Let  $F' = \text{Inv } \langle \eta \rangle$ . By the Fundamental Theorem of Galois Theory, we know that  $[E:F'] = n$  and  $\text{Gal } E/F' = \langle \eta \rangle$ . On the other hand, since  $\eta \in \text{Gal } E/F$ ,  $F \subset F' = \text{Inv } \langle \eta \rangle$ . Since  $n = [E:F] = [E:F'][F':F] = n[F':F]$  we have  $F' = F$  and so  $E$  is Galois over  $F$  with  $\text{Gal } E/F = \langle \eta \rangle$ .  $\square$

[REDACTED]

[REDACTED]

Suppose  $K$  is a subfield of  $E/F$ . Then  $m = [K:F] \mid n = [E:F]$ . On the other hand, let  $m$  be any divisor of  $n$ . Then the cyclic group  $\text{Gal } E/F$  has one and only one subgroup of order  $n/m$ . Hence, by the Fundamental Theorem of

where the product is taken over all monic irreducible polynomials of degrees dividing  $n$ . Since  $x^{q^n} - x$  has no multiple roots and hence no multiple factors in  $F[x]$ , it suffices to show that a monic irreducible polynomial  $g(x)$  is a factor of  $x^{q^n} - x$  if and only if its degree  $m$  is a divisor of  $n$ . Let  $g(x)$  be a monic irreducible factor of  $x^{q^n} - x$  in  $F[x]$ ,  $\deg g(x) = m$ , and let  $E$  be an extension field of  $F$  with  $[E:F] = n$ . Then  $E$  is a splitting field over  $F$  of  $x^{q^n} - x$  and hence  $E$  contains a root  $r$  of  $g(x)$ . Then  $g(x)$  is the minimum polynomial of  $r$  over  $F$ . Hence  $F(r)$  is a subfield of  $E/F$  such that  $[F(r):F] = m$ . Then  $m|n$ . Conversely, let  $g(x)$  be a monic irreducible polynomial in  $F[x]$  of degree  $m|n$ . Then  $K' = F[x]/(g(x))$  is an extension field of  $F$  with  $|K'| = q^m$ . Since  $m|n$ ,  $K'$  is isomorphic to a subfield  $K$  of  $E/F$ . Then  $E$  contains an element  $r$  whose minimum polynomial over  $F$  is  $g(x)$ . Since  $r^{q^m} = r$ ,  $g(x)|(x^{q^m} - x)$ . This establishes the factorization (70) where  $g(x)$  runs through the set of monic irreducible polynomials in  $F[x]$  of degree  $m|n$ . Comparing the degrees of the two sides of (70) we obtain
